All current and future pages must be constructed using valid HTML. Please make sure every page is validated using the W3C validator. Make sure you fix any errors, warnings are ok.	🟩
Please make sure any spaces are removed from folder and files names that live within your internet_tech directory. Using spaces in files/folder names is very bad practice and will cause you problems down the line.	🟩

It's really important that your anchor tag $href$ attribute values comply to the the following rules:
 	
• Never use \ in the path. You should only use / to specify a path.
• Do not use absolute file path. Absolute file paths e.g.
           ** Session 1 **
• Using the above link path will mean your site wont work when you upload to the server. All of your links must be relative, e.g:
           ** Session 1 **
	🟩

Ensure all of your HTML pages are formatted correct. This means that all child tags must be indented relation to their parent tags.	🟩
